

## **Homework Assignment 1: Reflections, ideas, and planning**

1. Based on the report of my fellow classmate, I figured out the issue of drivers forgetting their car keys, a solution to which can be using air tags that keep a track of your objects and give very précised location of your keys. An alternative solution to the same issue was given by a car company named Tesla as well that uses keys in mobile through a mobile application.
2. One of the solutions to cope up between the developer's and customer's need is that the developer ensures to the third-party client of maintaining and letting grow a very loyal customer base through creativity in database management, security, and reliability. By this, the developer can establish a link between the customer and any organization/enterprise to make money.
3. Based on the repost of my fellow classmate, I found that one of his mates came across the issue of difficulty in finding websites that showed up ongoing discount at different stores at a single place. When I gave her a solution that there already exists a website that deals with similar stuff named '[myunidays.com](https://myunidays.com)' and walked her through it, she concluded that the UI/UX of the website is good and the offers on the website are relevant. The impressive part of the website was the way the data was organized and the relevant details were easy to find.
4. As per the previous class, I came to know about a few ideas of overcoming people's issue with similar type of stuffs and want to proceed with developing a website on an idea that convinced me to develop this. The idea was to develop a website called "Social Networking Web Application" and I want to develop my IWS project on that.
